Frost Proof Cabbage Plants

Genuine Field Grown, which are the hardiest. Will mature three weeks earlier than your home-grown plants. Varieties: Jersey Wakefield, Charleston Wakefield, Succession and Early Flat Dutch.

These plants are grown in the open field during the fall and winter months, which causes them to make a slow, tough, hardy growth—so hardy that the outer leaves turn to a reddish brown. They can be shipped to distant points without danger of spoiling, and should be planted in the open ground from four to five weeks earlier than frame plants.

The plants, when received, will be somewhat wilted and have a hard stunted appearance, which will be disappointing to persons who have never used these plants before. Regardless of appearance, they will produce the crop results.

Prices: Parcel Post paid, 100, 50c; 500, $1.60; 1,000, $3.00.

Not prepaid, by express, 500, $1.25; 1,000, $2.00; 5,000, $7.50; 10,000, $12.50.

No order filled for less than 100 of a variety. We do not ship any plants C. O. D. Our terms are cash with order.

Seed Corn

We make a specialty of the best Seed Corn, and our volume of business enables us to supply the best corn at prices that are very reasonable. Indeed, as a bushel of corn will plant six to eight acres, there is no excuse for any farmer planting anything but the best.

We have made a study of corn growing. We know good corn when we see it, and we know how to select only the best. For general field crops we urgently recommend our Southern grown varieties, however, for a quick maturing crop we are prepared to furnish the best of the Northern varieties. Whatever variety you may select, you may be assured that you can depend on getting the best seed from us.

BOONE COUNTY WHITE — A large eared variety. It is especially adapted to Southern States. Requires from 100 to 120 days to mature. The ears are of large size, well proportioned, well rounded at butt and tip. Qt. 30c; gallon 80c. Parcel Post paid. Not prepaid—Qt. 20c; gal. 55c; peck $1.00; bushel $3.50.

IOWA SILVER MINE (100 days)—The stalks grow to a height of 7 to 8 feet and set the ears about 3 1/2 to 4 feet from the ground. The ears measure from 10 to 12 inches in length. They are very uniform in size and shape, 18 to 20 straight rows of deep, pure white kernels on a small cob. It is the heaviest yielder we know, having yielded over 100 bushels to the acre. Seventy pounds of ears will make 62 pounds of corn. It is entirely distinct and will give satisfaction. Qt. 50c; gal. 80c. Parcel Post paid. Not prepaid—Qt. 25c; gal. 55c; peck $1.00; bushel $3.50.

YELLOW LEANING—A very early growing corn; matures in about 90 days; always dries out quickly, therefore a desirable variety for early crop. Qt. 30c; gal. 75c. Parcel Post paid. Not prepaid—Qt. 20c; gal. 50c; peck 80c; bu. $3.25.

HASTINGS PROLIFIC WHITE—This variety of corn is prolific even under unfavorable conditions; two ears are formed on a stalk. They are naturally small, weighing from seven to nine ounces, but the cobs are extremely small and the kernels average more than one-half an inch in depth. The production of two or more ears on almost every stalk is one of the reasons for the variety ranking so high in yield. Packet. 10c.; 1 lb. 30c; 2 lbs. 45c; postpaid; 14 lb. peck, $1.25; 56 lb. bu. $4.50, not prepaid.

**ENGLISH OR PERENNIAL RYE GRASS** — Is largely sold by blenders for lawns and for hay in combination with clover for winter lawns on Bermuda sod. The Bermuda blades being easily affected by frost, become red and rusty looking, while English Rye, during Winter, presents a most beautiful appearance, being of a vivid green, and as the Bermuda during April and May makes its appearance it overgrows the English Rye, causing the later to decay and act as a fertilizer to the existing grass. It’s also valuable for permanent pasture as it makes a heavy growth. The Bermuda sod should be mowed as closely as possible, scarify the surface thoroughly, broadcast the English Rye on top, rake in and cover with a light soil. Similar to Italian Rye, but a little slower in offgrowth. It should be sown from September to March, at the rate of 50 lbs. per acre. 1 lb. 30c; postpaid; 10 lbs. $3.00; 20 lb. bu. $4.50; 100, $18.00 not prepaid.

Clovers

ALFALFA OR LUCERNE CLOVER—The most talked of and most widely planted of all the varieties of clover. Alfalfa in the South will produce 5 to 7 tons of hay to the acre each year and in money value is worth 45 per cent more than other clovers and 60 per cent more than Timothy hay. It will grow 4 or 5 crops a year and it does not exhaust the soil; it enriches the soil. Its long branching roots penetrate far down, 15 to 20 feet, and so loosens the subsoil that it is a gigantic subsoiler, resists drought, and gets plant food where other crops would be a failure. It is said that the feeding value of a ton of alfalfa is equal to a ton of shell corn. Plant from January to April for Spring, and September to November for Fall at the rate of 30 lbs. per acre.

We handle the following brands:
Peruvian—Price, postpaid, 50c per pound; not prepaid, $15.00 per bushel.
Kansas Fancy—Price, postpaid, 40c per pound; not prepaid, $15.50 per bushel.

ALSIKE CLOVER—Lb. 50c, postpaid; 10 lbs. $4.50; 60 lbs. to bushel. Lb. 60c, postpaid; 10 lbs. $3.00; bu. $12.00, not prepaid.

MEDIUM RED CLOVER—The most universally grown throughout the country. On fertile soil and especially where hay is desired, it has only one superior, and that is Alfalfa. Sow in the Spring and fall, 12 pounds per acre. Lb. 60c, postpaid; 10 lbs. $4.50; bu. $31.00, not prepaid.

WHITE DUTCH CLOVER—This is the common little running clover found in most good pastures. Its chemical analysis shows it to be richer in protein than almost any other legume which we grow for forage. It is, of course, too small to grow for hay, but it is invaluable in all pastures. Sow in Spring and Fall, 8 pounds to acre. 1 lb. $1.00, postpaid; 1 lbs. $9.00, not prepaid. Write for quantity prices.

FELLOW BLOSSOM SWEET CLOVER—Per lb. 35c, postpaid; 1 bu. 60 lbs. $7.00, not prepaid.

JAPANESE CLOVER OR LESPEDEZA—One of the most valuable Southern clovers, growing well on rich or poor soil. On poor land it has a creeping habit; on better quality of land it produces a bush form, making a vigorous plant, growing 12 to 18 inches high. Sow in spring or fall, about 25 pounds per acre. Harrow in to the depth of 1½ to 2 inches, according to character of soil, then roll or firm the soil in the most convenient way. Makes good grazing. Well adapted for use as green manure by turning it under; it enriches the soil and prevents "washing" of hill lands. Its abundant long taproots and laterals decaying make the soil porous and leave in it much valuable nitrogenous matter to be used by the following crops. Roots penetrate deeply, enabling the plant to stand severe dry spells, also bring up valuable plant food from the subsoil. For Louisians plant from December to March; in Florida sow in the fall for best results; in Georgia, Texas, Alabama and Mississippi sow in March or early April. Lb. 50c, postpaid. Write for prices on bushel or larger lots.

WHITE BLOSSOM SWEET CLOVER—Millotus Alba or Bokhara. A relative of alfalfa and will make luxuriant growth on soils rich in lime and of insufficient depth for successful growing, of either Alfalfa or Red Clover. Seeds may be sown at the rate of 20 pounds to the acre from September to December or February to April, producing one cutting the first season, but furnishes three cuttings thereafter of from one to two each. Hulled, weight 60 pounds to bushel. 35c per lb. postpaid; 10 lbs. $3.00; bu. $12.00, not prepaid.

CRIMSON CLOVER—For the South. Farmers all through the Middle Atlantic and Southern States are increasing the acreage of Crimson Clover very materially, as they find it one of the best and most satisfactory of early forage and soil-improving crops. Its greatest value is a soil-improver, practical farmers maintaining that a crop of Crimson Clover turned under is equal to a good application of stable manure. Planted during September, October, February and March. Twenty pounds per acre, 60 lbs. to bushel. Lb. 40c, postpaid; 10 lbs. $2.25, not prepaid.

Wheat

RED MAY WHEAT—We have never been able to see where this variety was any earlier and better than the Fultz, although many prefer it to that variety, claiming great earliness. It is a standard variety. Beardless. Price, lb 25c, postpaid; peck, $1.00; bu. 60 lbs. $3.25 not prepaid.

Directions for Planting and Cultivating Cotton.

Thoroughly break and prepare your land early, having the rows 3 1/2 to 4 feet wide, and hill 12 to 14 inches apart in drill. When the cotton comes up it should be off-barred deep while it is small, in order to let the heat of the sun strike through the beds. As it gets larger shallow down, and towards the last cultivate very shallow. Always keep the top crust of the ground broken in dry weather, as it prevents it from losing its forms. Never stop plowing for wet weather until the ground turns in slices; then quit immediately until it dries off. Never lay-by until the middle of August. The most successful time we know of for planting for a big yield is on the 5th and 6th days of April; in fact, the first week in April is the best time for planting cotton for good results. One bushel of cotton seed is required to plant an acre. All of our Cotton Seed is free from Boll Weevil. These are all good varieties which have been thoroughly tested and recommended by Agricultural Colleges and Experiment Stations of the Southern States.

EXPRESS COTTON—The Experimental Station at Starkville, Miss., recommending it above all others. It has been planted for several years and has been found prolific, early maturing, and much sought after by the cotton buyers. It is a fine character of cotton, a strong 1 3/16 inch staple, always commanding a good liberal premium. 1 lb. 50c, postpaid; bu. 30 lbs. $3.50, not prepaid.

EARLY KING COTTON—Extra long staple; lint 1% or 1 1/2 to 2 inches. Seed black and lintless. Plant 1 1/2 bushel to acre in row—5 foot rows, 3-foot drill. The famous Sea Island Cottons are known all over. 1 lb. 50c, postpaid; bu. 40 lbs. $6.50, not prepaid.

SIMPSON'S EARLY PROLIFIC COTTON—(Short staple.)—The superiority of this cotton over all others consists of its extreme earliness and heavy fruiting; has long limbs, which come out at the ground. 1 lb. 30c, postpaid; bu. 30 lbs. $3.25, not prepaid.

KING'S EARLY IMPROVED COTTON—This short staple Cotton has wonderfully increased in popularity. It is extra early, wonderfully prolific, long limbed, seed small, lint 36 to 40 per cent. 1 lb. 30c, postpaid; bu. 30 lbs. $3.25, not prepaid.

ALLEN'S IMPROVED COTTON—(Long Staple). Runs full 1 1/4 to 1 1/2. Considered by the mills as the most desirable cotton raised in the United States. Sea Island excepted. 1 lb. 50c, postpaid; bu. 30 lbs. $3.50, not prepaid.

WANNAMAKER CLEVELAND BIG BOLL—Plant vigorous, thrifty, with low close-jointed basal fruit limbs; large bolls easily picked, medium size seed, 34 to 35 per cent lint, 1 1/2 to 1 3/4 inches long, fine and strong. Earliest and most prolific at experimental stations. Especially recommended for sections where the boll weevil is present. 1 lb. 30c, postpaid; bu. 30 lbs. $3.25, not prepaid.

Special prices on large quantities of any of the above Cotton Seed.

Rye

ROSEN RYE—Rosen Rye in comparison with other ryes in the same season has the reputation of yielding 10 bushels more and sometimes 15 bushels more to the acre. Planted from September to December, 1 1/2 bushels per acre. 50 lbs. per bushel, 1 lb. 35c, postpaid; 1/2 bu. $1.00; bu. $3.75, not prepaid.

RYE (Southern Grown)—It stools heavily, can be grazed several times and then allowed to go to seed. Cut and fed green; has made as much as ten tons of green food per acre in five months. It is sown from the middle of August until November, and then again in the early Spring. The main planting time is in the Fall, however, as it is more valuable when sown early. It is a very hardy plant, withstanding all kinds of very cold weather without serious injury. Sown both broadcast and in drills; 1 1/2 bushels per acre. The seed should be covered no more than two inches. For hogs, sow from September 10th to November 1st, together with crimson clover. Graze from December 1st to April 15th. Rye can be planted for late Fall and Winter grazing at the last laying by of cotton, 1 lb. 25c, postpaid; peck, $1.00; 56 lb. bu. $3.50, not prepaid.

Velvet and Soy Beans for Fertilizers

MAMMOTH YELLOW SOJA—One of the most valuable forage plants for pasturing or feeding green. The vines are bushy and of vigorous, erect habit. Fed in the green state, they afford most nutritious forage. Sow broadcast at the rate of one-half bushel to the acre, or plant in drills $\frac{3}{4}$ feet apart, and $\frac{1}{2}$ feet between the plants, dropping three beans in a hill. One gallon will sow one acre, if drilled. Planted from March to August. 1 lb. 25c, postpaid; 15 lb. peck, $1.50; 60 lb. bu. $4.00, not prepaid.

EXTRA EARLY SPECKLED VELVET—Is very productive, making from one to two tons of beans in hull per acre. Land that will make 20 bushels of corn, will make one ton of beans in addition to the corn, doubling the feed value of every acre planted. It is a great fattener for all stock, and one of the greatest milk producers. As the hull is very thin, proportion of seed to hull is about double that of the thick hulled varieties. Does not pop open and will remain good in field indefinitely if it is clear of the ground. One peck to the acre. Planted from March to August. Lb. 25c, postpaid, 15 lb. peck, $3.00; 60 lb. bu. $11.00, not prepaid.

LAREDO—A variety that is a distinct addition to the forage crops of the Cotton Belt. As a soil builder, it ranks favorably with other summer legumes making equal growth. May be planted from the earliest cotton planting date to the first of July with reasonable certainty of a good crop. Seeds are very small and one bushel will plant from 8 to 10 acres in $2\frac{1}{2}$ ft. rows. Covered very lightly. Price, 50c. per lb. postpaid; 15 lb. peck, $3.00; 60 lb. bu. $10.00, not prepaid.

O-TOO-TAN—This is a fast-growing hay bean growing 4 to 5 feet high. The O-Too-Tan is a black bean, rather small. One half peck plants an acre in rows $2\frac{1}{2}$ to 3 feet apart.
